

SynthoCardio Induced Palpitations and Supraventricular Tachycardia in a Middle-Aged Female

Eleanor Clark, MD; Thomas Wright, MD; Heart & Vascular Division, United Kingdom

ABSTRACT

A 55-year-old female patient developed palpitations and dizziness 2 hours after receiving oral SynthoCardio 10mg. Clinical monitoring and subsequent dechallenge resulted in full recovery.

CASE PRESENTATION

A 55-year-old female (Weight: 68 kg, no prior cardiac arrhythmias) was initiated on oral SynthoCardio 10mg daily for mild hypertension. Two hours following the initial dose on 16 Aug 2026, she experienced acute palpitations, lightheadedness, and dizziness. ECG confirmed transient sinus tachycardia at 130 bpm. SynthoCardio was withdrawn immediately. Heart rate normalized within 4 hours. Outcome: Resolved. Case documented by Dr. Clark, Cardiologist.

DISCUSSION

Cardiovascular adverse reactions require close surveillance during initial titration. Causality assessment was categorized as probable based on immediate onset post-dose.
