

Acute Interstitial Reaction and Fatigue Secondary to SynthoStatin Pharmacotherapy

James Foster, MD; Renal Medicine Division, United States

ABSTRACT

A 69-year-old male developed severe fatigue, nausea, and fever following SynthoStatin 40mg administration. Dechallenge resulted in favorable clinical recovery.

CASE PRESENTATION

A 69-year-old male patient (Weight: 80 kg) initiated oral SynthoStatin 40mg on 10 Jul 2026. Three weeks later (onset 02 Aug 2026), he developed acute fatigue, nausea, and mild fever. Blood tests revealed serum creatinine rise. Following cessation of SynthoStatin, renal function stabilized and symptoms resolved (Outcome: Recovered). Reported by Dr. Foster, Nephrologist.

DISCUSSION

Immune-mediated adverse reactions to statins warrant comprehensive differential diagnosis in elderly patients.
